Query (Receive)

The query process is receiving volumes from another repository in a move status into the target repository, usually involving putting volumes into allocated slots.

The **Query** Option in the Toolbar will set the **Start Scan** operation to Query Mode.

Add required tapes to the Scan In window by right clicking either/or:

- Customer to add all media in a move status.
- Media Type to add all volumes in a move status of that media type.
- Repository to add all volumes in a move status from that repository.
- Target Repository to add all volumes moving from the current repository to the target repository.

Select required volumes, based on movement direction, from the **Add Filters** window by checking the boxes and clicking **OK**.

If any volumes are added by error, select from the main menu Process→Special Operations→Clear Selected to remove all volumes. Add new selection of volumes by following the previous steps.
