

Synopsis

TMSS10Inventory [-V volume filter] [-N relative resolve] [-S logonstring] [-c config file] [-R Scan list file output] Description

TMSS10Inventory produces an Inventory Report of all selected Volumes

Options

-V

The volume filter argument sets the Volume Filter which can be used to filter the traversal of Customer, Media and Volume values. The format of this filter is c.m.v@r, where c is Customer-ID filter, m is Media-ID filter, v is Volume-ID filter and r is Repository-ID filter. To process only volumes not in Repository ACME, `"*.*.!*@(ACME)`.

-N

No Relative Resolve.

-S

The logon string argument sets the Server logon information in the format `user:password@server:port`. In the event that this argument is not passed the default will be `batch:batch@localhost:5000`. By default the password value will be treated as the path to a file which contains a single record representing the password, rather than the password itself. If you wish the password value to be the literal password (rather than a file) the password should be prepended with a dash (`fred:-fredspassword@server`). You can also have the program read the password as the first record of stdin by prepending the password with a plus symbol (`fred:+@server`). In the event that the password is all upper case and 32 characters in length, the password will be considered an MD5 hash of the password and passed to the server without subsequent MD5 hashing.

-c

The config file argument specifies the path to the Batch Configuration File. The Batch Configuration File allows you to perform advanced traversal of Customer, Media and Volumes, perform advanced barcode pre and post processing and route program output to syslogd. Configuration File capabilities vary from program to program but the syntax remains the same. In the event that logic is not supported it will simply be ignored. The following example will set the default Customer-ID and Media-ID for all scanned barcodes:

```
barcodes = {
```

```
defaults={ customer-id="ACME"; media-id="LTO"; };
```

```
}; -R Output a Scan List File.
```

Notes

Technical Support

The TapeTrack Software is commercially supported by a full time help desk staff. If you are experiencing problems or want some advice on how to configure or use the product please see the

Accessing Technical Support page.

Exit Statuses

zero:

Program has ended successfully.

non-zero:

Program has not ended successfully.

Environment

TMSSSERVERPROXY If defined the program will route all TapeTrack TCP/IP traffic through a HTTPS proxy. The value of the variable should be in the format user:password@host:port. To debug the proxy connection use variable **TMSSAPILOGDIR**.

TMSSAPILOGDIR If defined the program will write out a trace file to this directory.

TMSSPPATH When no password value is passed in the logon string the program will look for the password in file C:/tapetrack/pw/batch, where user is the user value passed in the logonstring. If you wish to change this default path, you can set the path in **TMSSPPATH**.

TMSSNOMD5 If defined the program will not MD5 hash passwords before sending them to the TapeTrack Server. This is required when relying on Windows Active Directory authentication. It should be noted that although the password is not being hashed, it is still being encrypted during transmission.

Example

```
C:\WINDOWS\system32>tmss10inventory -S user:-password@server -V "US01.LTO.00000?L6"
