Adding a Desktop Server Connection

When using the TapeTrack Desktop Software you will have to have one or more TapeTrack Framework Server entries defined so that you can connect to a server endpoint.

To configure a server you will need the following information:

- 1. The server IP Address or DSN Name.
- 2. The server port (usually 5000).
- 3. If you are connecting via a HTTP Proxy:
 - Unordered List Item

This can be done in the following ways:

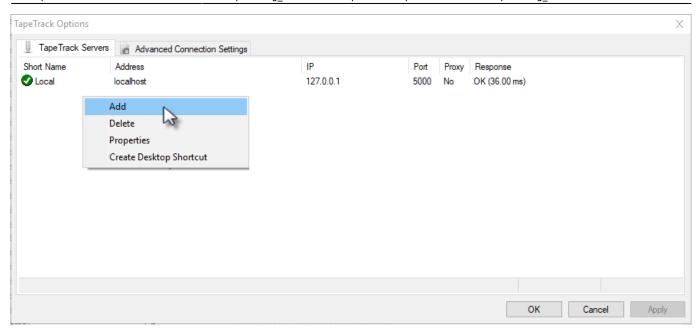

- 1. Adding a connection interactively.
- 2. Adding a connection to the Configuration File.
- 3. Clicking on a URL.
- 4. Clicking a Windows Registry File.

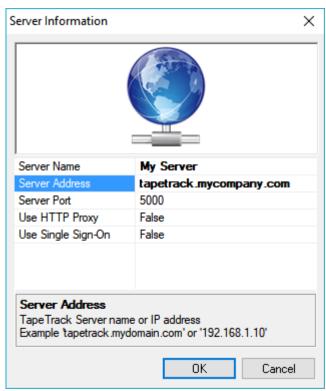

When using TapeTrack TapeMaster that was installed as part of the TapeTrack Framework Server installation, an entry for localhost will be automatically added by the installer.

Adding a connection interactively
