

# Disabling Update Check

On startup TapeTrack software checks via internet connection whether an update is available. This function can cause some security setups to issue a warning. This can be avoided by setting a registry key to disable the update check.

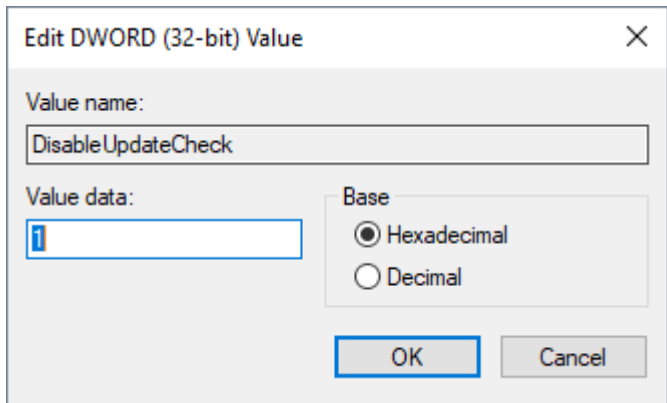

## Adding Registry Key

In regedit navigate to HKEY\_LOCAL\_MACHINE\SOFTWARE\GazillaByte. Right-click in main window and select New - DWORD.

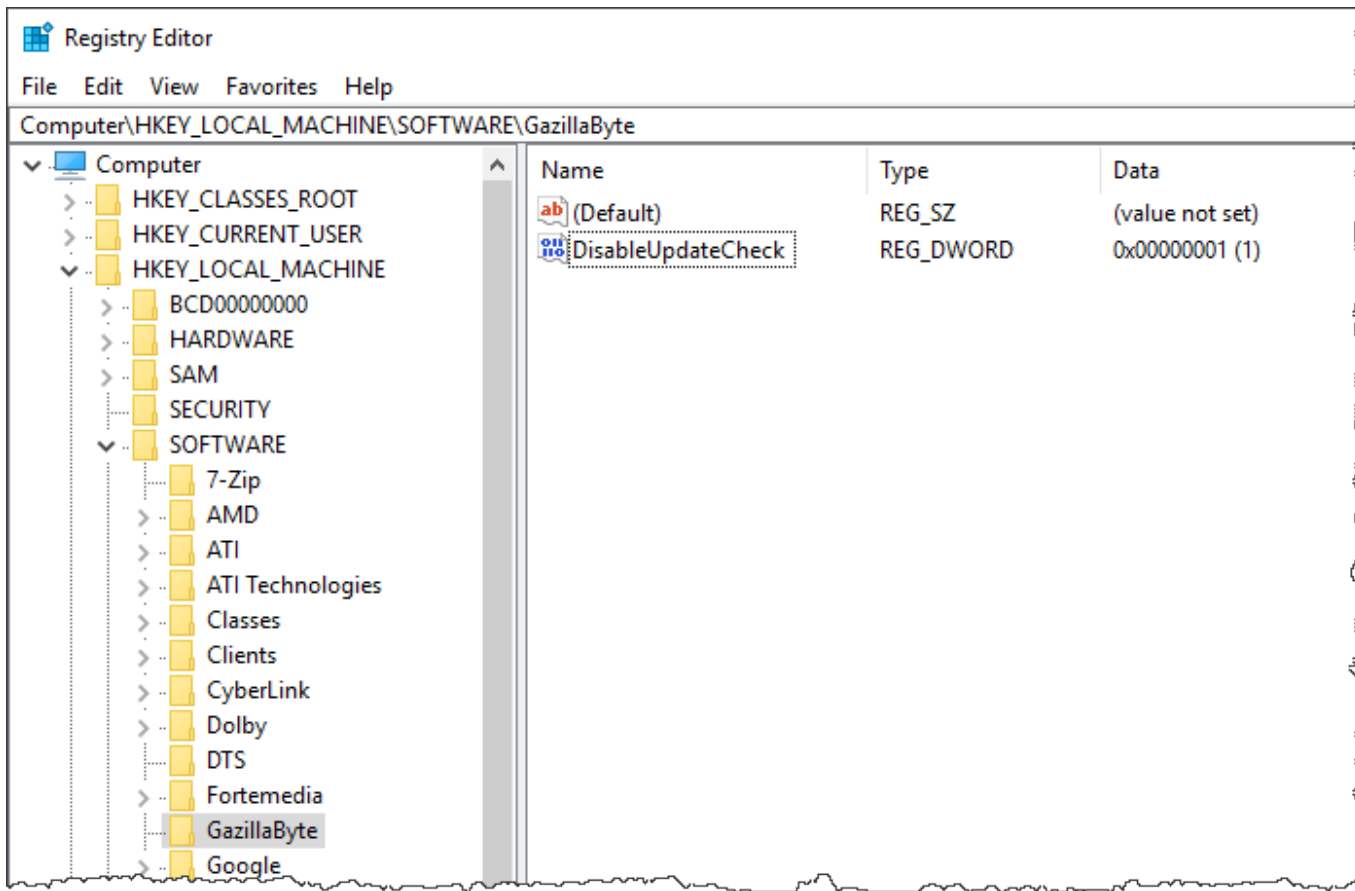

Right-click the newly created key and select rename. Give the key the name **DisableUpdateCheck**.

Double-click the key and set the value to **1**.

Once complete your registry will have the added key with the value of one, Tapetrack will no longer check for updates.

Close regedit by clicking File → Exit.
