

# Changing Connection Port

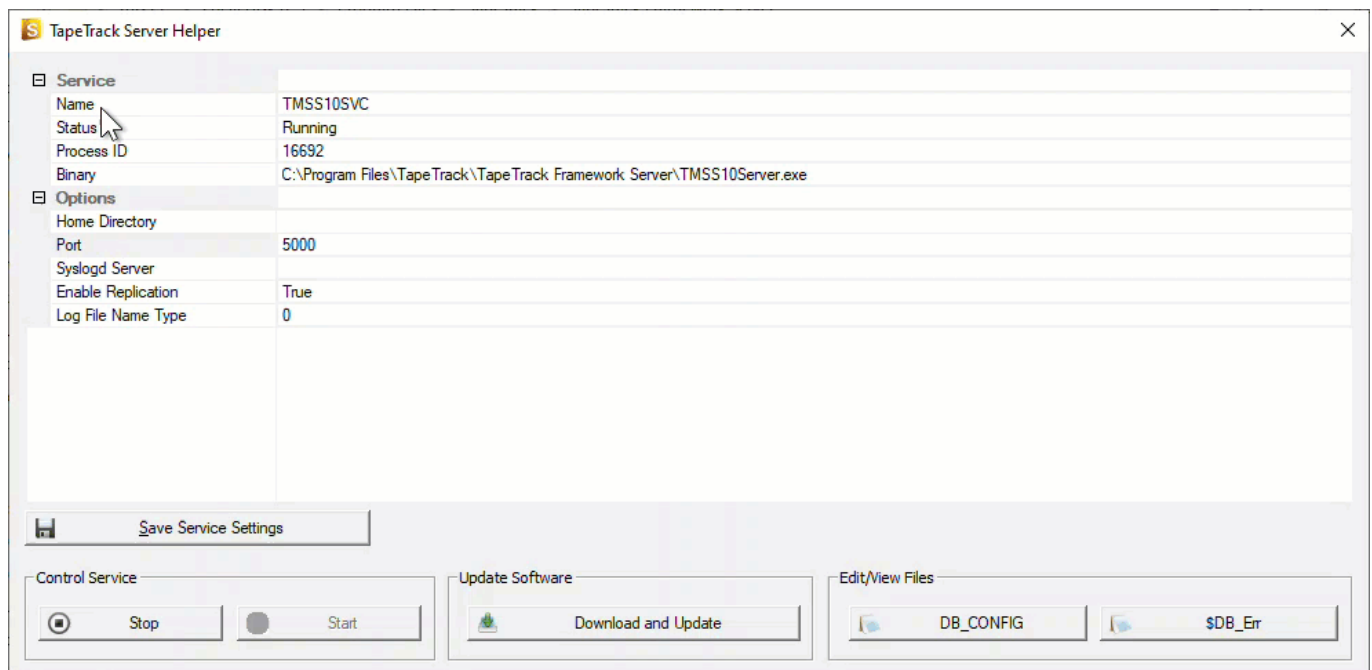

During an upgrade or migration of your TapeTrack Server you may choose to change which port the Framework communicates with the Desktop Client programs.

## Changing Port Allocation

Open the Framework Server Helper which is installed in the directory TapeTrack\TapeTrack Framework Server, (default location C:\Program Files\TapeTrack\TapeTrack Framework Server) by double clicking on the executable TMSS10ServerHelper.exe.

Change the port number in the field Port under the Options section to the required port number, in this example from port 5000 to 443.

Click Save Service Settings to update the data.

[Stop and then start the TapeTrack Service](#) to allow the Framework Server to access the new port.

The screenshot shows the 'TapeTrack Server Helper' application window. It features a tree view on the left with 'Service' and 'Options' expanded. The 'Service' section displays the following details:

Name	TMSS10SVC
Status	Running
Process ID	16692
Binary	C:\Program Files\TapeTrack\TapeTrack Framework Server\TMSS10Server.exe

The 'Options' section displays the following details:

Home Directory	
Port	443
Syslogd Server	
Enable Replication	True
Log File Name Type	0

At the bottom of the window, there are three main control panels: 'Control Service' with 'Stop' and 'Start' buttons; 'Update Software' with a 'Download and Update' button; and 'Edit/View Files' with 'DB\_CONFIG' and '\$DB\_Err' buttons. A 'Save Service Settings' button is also present above the control panels.
