## **Configuration File**

A configuration file can be passed to the Server Utilities to enable selective processing of Volumes based on their inclusion or exclusion in a scan file list.

It also allows the scan file to be pointed to a definition file that can be used to create the scan list from a file that requires parsing before input into TapeTrack.

## **Config File Example**

```
traversal =
{
   scanfile= { file="rename.ttidef"; };
   customer =
      {
          id="*";
          media =
             {
                id="*";
                volume =
                     {
                        id="*";
                        scanfile=true;
                        skip=false;
                     },
                        id="*";
                        skip=true;
                );
             }
         );
      }
   );
};
```
