

Configuration File

A configuration file can be passed to the Server Utilities to enable selective processing of Volumes based on their inclusion or exclusion in a scan file list.

It also allows the scan file to be pointed to a definition file that can be used to create the scan list from a file that requires parsing before input into TapeTrack.

Config File Example

```
traversal =
{
  scanfile= { file="rename.ttidef"; };
  customer =
  (
    {
      id="*";
      media =
      (
        {
          id="*";
          volume =
          (
            {
              id="*";
              scanfile=true;
              skip=false;
            },
            {
              id="*";
              skip=true;
            }
          )
        }
      );
    }
  );
};
```
