

Configuration File

A configuration file can be passed to the Server Utilities to enable selective processing of Volumes based on their inclusion or exclusion in a scan file list.

It also allows the scan file to be pointed to a definition file that can be used to create the scan list from a file that requires parsing before input into TapeTrack.

Config File Example

```
traversal =
{
    scanfile= { file="example.ttidef"; };
    customer =
    (
        {
            id="*";
            media =
            (
                {
                    id="*";
                    volume =
                    (
                        {
                            id="*";
                            scanfile=true;
                            skip=false;
                        },
                        {
                            id="*";
                            skip=true;
                        }
                    );
                }
            );
        }
    );
};
```
