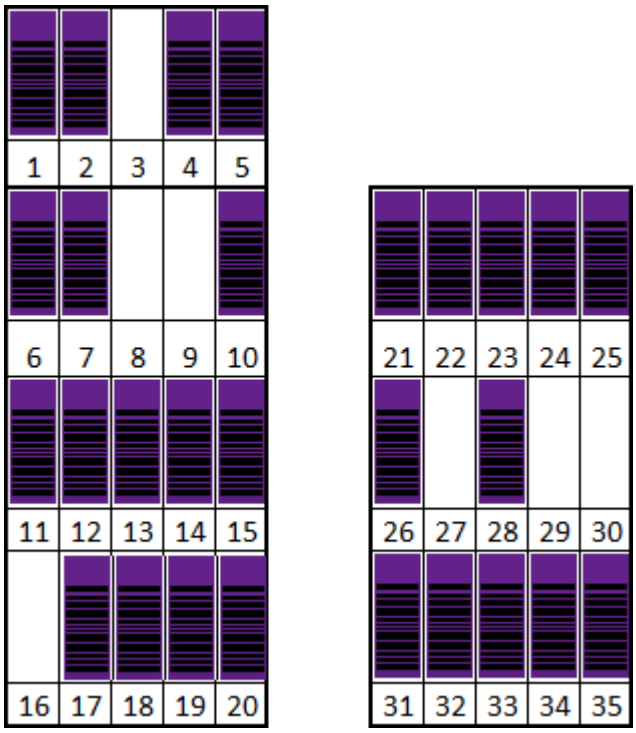
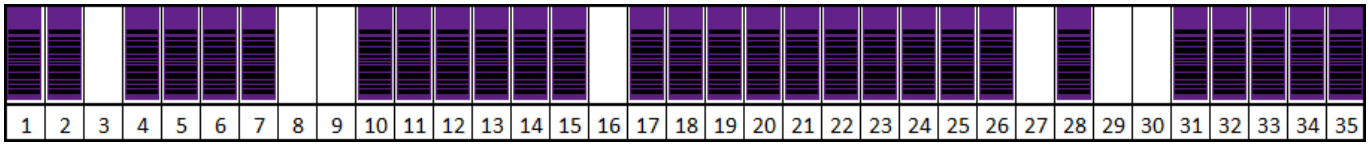
Preparing Racking And Volumes For Slotting

While your Volumes are stored in Gemtrac racks, or similar, to remove the differences in racking capacity and layout the following methods are displayed as if your entire racking was laid out in one linear line.

Sample racking layout, rack_1 25 Slot, 5 Slots per shelf. Rack_2 20 Slot, 5 Slots per shelf.

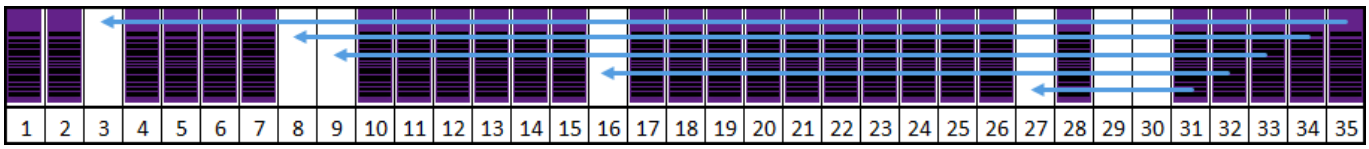


Racking laid out in linear format to eliminate specific racking layouts and display in a more generic format.

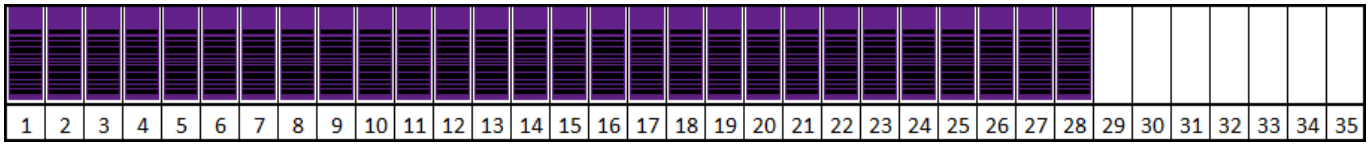


Method 1

The fastest method to compact the Volumes in the racking slots is to move Volumes from end of Slots to fill gaps.



After moving Volumes.



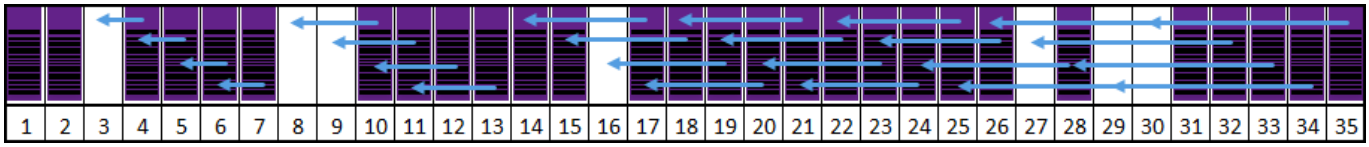
In this example the Volumes can be compacted within 5 moves, obviously the larger your racking and the more Volumes and gaps present the more moves will be required. It does, however, give you a comparison point for the method you choose to use.

The Volumes are then scanned to file in order, starting at Slot 1 and repeating until the last one is scanned.

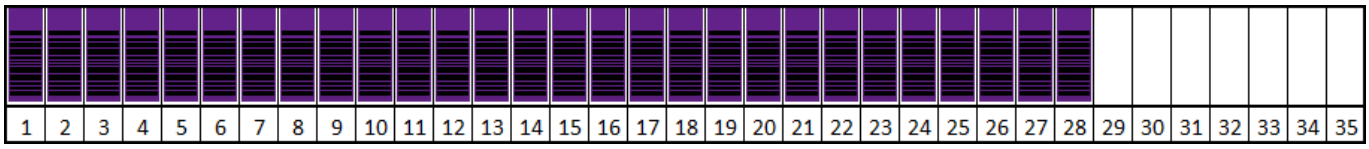
This file is then loaded into TapeMaster with the first entry being assigned to Slot one, the second entry to Slot 2 etc.

Method 2

If the order of the Volumes is important to maintain, move the Volumes one at a time to sequentially fill in the voids, using the original image as an example move Volume in Slot 4 to Slot 3, Volume in Slot 5 into Slot 4 and continue until all empty Slots have been filled. While this will keep the order the Volumes are in it will entail a lot more labour and time to complete.



After moving Volumes.



In this example the Volumes can be compacted within 25 moves, obviously the larger your racking and the more Volumes and gaps present the more moves will be required

The Volumes are then scanned to file in order, starting at Slot 1 and repeating until the last one is scanned.

This file is then loaded into TapeMaster with the first entry being assigned to Slot one, the second entry to Slot 2 etc.

Method 3

Volumes are left in their current Slots and each Volume-ID is recorded in a Excel spreadsheet, or similar, for importation into TapeMaster. To do this you need a thorough understanding of Virtual and Physical Slotting principles and put the required labour into recording each Volume-ID and its corresponding Slot number.

This method relies on you having a Zone layout that is configured in a correct manner so that each Zone, shelf and Slots are in a logical order that can be setup in TapeTrack and the data imported.

Sample excel file

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	Slot Number	Volume-ID											
2	1	000004L6											
3	2	000005L6											
4	4	000022L6											
5	5	000028L6											
6	6	000029L6											
7	7	000041L6											
8	10	000057L6											
9	11	000063L5											
10	12	000091L6											
11	13	000100L6											
12	14	000105L6											
13	15	000134L6											
14	17	000137L6											
15	18	000151L6											
16	19	000154L6											
17	20	000158L6											
18	21	000163L6											
19	22	000167L6
