Renaming A Batch Of Volume-ID's

Renaming a batch of Volumes can be completed in one process using a configuration file, definition file, Volume List and TMSS10VolumeRename.

When TMSS10VolumeRename is executed, the configuration file will use the definition file to load the Volumes into a scan list.

Volumes from the target Customer are then compared to the Scan list and either processed (if in the Scan list) or discarded (if not in the Scan list)

The Volumes processed are then renamed according to the logic in the Command Line code.

Example Files

Adding L5 suffix to all Volumes in the input file volumes.txt for Customer US04, Media LTO.

Volume File

volumes.txt

100001L5		
100002L5		
100003L5		
100004L5		
100005L5		
100006L5		
100007L5		
100008L5		
100009L5		
100010L5
