

# Renaming A Batch Of Volume-ID's

Renaming a batch of Volumes can be completed in one process using a configuration file, definition file, Volume List and [TMSS10VolumeRename](#).

When [TMSS10VolumeRename](#) is executed, the configuration file will use the definition file to load the Volumes into a scan list.

Volumes from the target Customer are then compared to the Scan list and either processed (if in the Scan list) or discarded (if not in the Scan list)

The Volumes processed are then renamed according to the logic in the Command Line code.

## Example Files

Adding L5 suffix to all Volumes in the input file volumes.txt for Customer US04, Media LTO.

### Volume File

volumes.txt

```
100001L5
100002L5
100003L5
100004L5
100005L5
100006L5
100007L5
100008L5
100009L5
100010L5
```
