# **Upgrading**

There are many reasons to upgrade both hardware and software, unsupported releases, security updates or simply making use new features.

The process of performing an upgrade can be as simple as reinstallation of a software package all the way through to a complete hardware rebuild and a new operating system or migration from a physical server to the cloud.

#### **Upgrading TapeTrack Client Software**

As TapeTrack is a Client/Server architecture, upgrading the client side software is a fairly simple process as there is no need to backup the database or stop the Framework Server whilst the upgrade is completed. The other point to remember, upgrading TapeMaster (or Lite, or Checkpoint) on one computer will only affect that computer. Any other computers you have TapeTrack Client Software installed on will need to be updated on their own. It is also possible to have different versions of TapeMaster (or Lite, or Checkpoint) on several computers all able to simultaneously connected to the Framework Server.

Upgrading TapeTrack Desktop Client Software Process:

- Downloading the latest release executable
- Uninstalling the currently installed version
- Installing the latest release

For detailed information see:

Upgrading Lite Upgrading TapeMaster Upgrading Checkpoint

#### **Upgrading TapeTrack Server Software**

Upgrading the Framework Server, although similar to the Desktop Client side software, requires a few more steps to ensure the database integrity is maintained.

You will also need to schedule a time to perform the upgrade as you will need to shut down the Framework Server so consideration will need to be given to when any Syncs are scheduled or Customers may be accessing the data.

For detailed information see Upgrade Server.

## **Upgrading Operating System**

Upgrading to a new operating system, such as Windows Server 2019, the actions required depend on

the process you select for the upgrade.

Most server upgrades will allow you to select an option to keep personal files, while by design this should ensure the integrity of your database and associated files, it is best practice to take a backup of the database, Sync files and any other scheduled TapeTrack task files.
