Troubleshooter: Replication Previously Setup And Running

Replication previously set up and running

Is the master server running

Yes

Is the replicant server running

Yes

Are the ports used by the master and replicant open and listening

Yes

No

Have your network staff open the required ports for inbound and outbound communications

Not sure

Checking master to replicant port access

Checking replicant to master port access

> 💡 The following commands are using default install values. If these values do not match our installation you will need to replace with the correct database location and required ports

Stop the replicant server. Open config file, comment out replicant section and save file restart server in foreground mode, using the command in an administrative command line window

```
TMSS10Server -f -h "%TMSS10DB%" -p 5010
```

Open another administrative command line window and execute the command

```
netstat -na  | find "5010"
```

to check that the port is actively listening. If it is you will receive output similar to

```
netstat -na  | find "5010"
```

```
TCP    0.0.0.0:5010              0.0.0.0:0
LISTENING
```

From the master server run the command TMSS10Ping with the replicant server address and port.

Connection successful

Connection unsuccessful
    Have your network staff open the port

No
    Restart the replicant server using the Framework Server Helper, administrative command line or windows services

No

Not sure
    From an administrative command line window on the master server run the command TMSS10Ping

    Connection Successful
        From an administrative command line window on the replicant server run the command TMSS10Ping

        Connection Successful

        Connection Unsuccessful

    Connection Unsuccessful
        Restart the master server using the Framework Server Helper, administrative command line or windows services

server, replicate, update doco
