Replication previously set up and running

    Is the master server running

  Yes

    Is the replicant server running

  Yes

    Are the ports used by the master and replicant open and listening

  Yes

  No

    Have your network staff open the required ports for inbound and outbound communications

  Not sure

    Checking master to replicant port access

    Checking replicant to master port access

> The following commands are using default install values. If these values do not match our installation you will need to replace with the correct database location and required ports

Stop the replicant server. Open config file, comment out replicant section and save file restart server in foreground mode, using the command in an administrative command line window

```
TMSS10Server -f -h "%TMSS10DB%" -p 5010
```

Open another administrative command line window and execute the command

```
netstat -na  | find "5010"
```

to check that the port is actively listening. If it is you will receive output similar to

```
netstat -na  | find "5010"
 TCP    0.0.0.0:5010              0.0.0.0:0
LISTENING
```

From the master server run the command TMSS10Ping with the replicant server address and port.

Connection successful

Connection unsuccessful
Have your network staff open the port

No
Restart the replicant server using the Framework Server Helper, administrative command line or windows services

No

Not sure
From an administrative command line window on the master server run the command TMSS10Ping

Connection Successful
From an administrative command line window on the replicant server run the command TMSS10Ping

Connection Successful

Connection Unsuccessful

Connection Unsuccessful
Restart the master server using the Framework Server Helper, administrative command line or windows services
